Brainstorm and Idea Prioritization Template

Project: iMovies MERN **Document:** Brainstorm and Idea Prioritization Template

1. Project overview

Project name: iMovies MERN. Project type: web-based movie browsing and ticket-booking application. Intended users: moviegoers and administrators.

2. Problem opportunity

Moviegoers need a simple place to browse available movies, choose a show date and time, select seats, create a booking, and review or cancel their bookings. Administrators need a way to maintain movie listings and review bookings.

3. Brainstorming ideas

- Movie catalogue with title, description, genre, duration, rating, release year, poster/icon and ticket price.
- Search movies by title or related text.
- Account registration and login.
- Show date and show-time selection.
- Seat selection with a maximum selection limit.
- Booking summary and total price calculation.
- My Bookings page with cancellation option.
- Administrator login and dashboard.
- Admin ability to add or remove movies and view bookings.
- Responsive dark cinema-themed interface.
- Clear errors for unavailable seats, invalid credentials, or missing fields.

4. Idea prioritization

Idea / feature	User value	Effort	Priority
Browse movies	High	Low	Must-have
Register/login	High	Medium	Must-have
Book seats	High	High	Must-have
My Bookings/cancel	High	Medium	Must-have
Admin movie management	High	Medium	Must-have
Search movies	Medium	Low	Should-have
Live seat availability	High	High	Should-have
Online payment integration	High	High	Future enhancement
Reviews and recommendations	Medium	High	Could-have

5. Prioritization method

Use a simple MoSCoW approach: Must-have features are needed for a usable first version; Should-have features improve the experience; Could-have features can be postponed; Won’t-have features are outside the current scope.

6. Selected idea

Build an iMovies web application using MongoDB, Express.js, React and Node.js. Deliver a functional local prototype first, then validate it and deploy it when configuration and security are ready.

7. Assumptions and risks

Assumptions: users have a browser and internet/local network access; movie data is entered by an administrator. Risks: double booking, exposed secrets, weak authentication, database availability, and incomplete payment integration. Mitigation includes server-side validation, protected admin routes, environment variables, and testing.

Prepared for academic project documentation. Verify implementation-specific details and fill in actual test evidence before final submission.
