Problem-Solution Fit Template

Project: iMovies MERN **Document:** Problem-Solution Fit Template

1. Problem

Moviegoers need a clear, convenient way to discover movie listings and manage a ticket booking, while administrators need controlled access to maintain movie and booking data.

2. Target segment

Primary: people who want to browse movies and reserve seats through a web interface. Secondary: administrators responsible for movie listings and booking oversight.

3. Proposed value

iMovies brings movie browsing, search, show selection, seat selection, booking history and administration into one MERN web application.

4. Problem-solution mapping

Problem	Proposed feature	How it helps
Movie information is scattered	Movie catalogue and search	Central place to browse movie details.
Booking steps are unclear	Show/date/seat selection and summary	Makes selections and cost visible.
Users lose track of bookings	My Bookings page	Shows the signed-in user's booking records.
Admin data changes are manual	Admin dashboard	Supports movie management and booking review.
Duplicate seat reservations risk	Server-side reservation validation/index	Rejects conflicting reservations when correctly configured.

5. Fit hypotheses

- Users can understand the booking workflow without assistance.
- Showing price before booking increases confidence.
- Personal booking history is useful after checkout.
- Admins need protected routes and straightforward movie management.

6. Validation plan

Run the UAT scenarios with representative users. Observe completion time, failed steps, misunderstood labels, and defects. Use feedback to prioritize fixes rather than assuming product-market fit.

7. Risks and limitations

The current prototype uses a demo-payment flow, not a real payment gateway. Seat availability should be verified with the backend; a static seat grid alone does not prove real-time availability. Production use requires security, monitoring, privacy, backup and deployment reviews.

8. Fit decision template

Evidence collected: _____
Most important user feedback: _____
Top changes: _____
Decision: ■ Continue ■ Iterate ■ Reassess

Prepared for academic project documentation. Verify implementation-specific details and fill in actual test evidence before final submission.
